Marks Obtained : 10

Section 1 : Coding

1. Problem Statement

In a messaging application, users maintain a contact list with names and corresponding phone numbers. Develop a program to manage this contact list using a dictionary implemented with hashing.

The program allows users to add contacts, delete contacts, and check if a specific contact exists. Additionally, it provides an option to print the contact list in the order of insertion.

Input Format

The first line consists of an integer n , representing the number of contact pairs to be inserted.

Each of the next n lines consists of two strings separated by a space: the name of the contact (key) and the corresponding phone number (value).

The last line contains a string *k*, representing the contact to be checked or removed.

Output Format

If the given contact exists in the dictionary:

1. The first line prints "The given key is removed!" after removing it.
2. The next *n* - 1 lines print the updated contact list in the format: "Key: *X*; Value: *Y*" where *X* represents the contact's name and *Y* represents the phone number.

If the given contact does not exist in the dictionary:

1. The first line prints "The given key is not found!".
2. The next *n* lines print the original contact list in the format: "Key: *X*; Value: *Y*" where *X* represents the contact's name and *Y* represents the phone number.

Refer to the sample outputs for the formatting specifications.

Sample Test Case

Input: 3

Alice 1234567890

Bob 9876543210

Charlie 4567890123

Bob

Output: The given key is removed!

Key: Alice; Value: 1234567890

Key: Charlie; Value: 4567890123

Answer

```
void insertKeyValuePair(Dictionary *dict, const char *key, const char *value) {  
    if (dict->size >= dict->capacity) {  
        dict->capacity *= 2;  
        dict->pairs = (KeyValuePair *)realloc(dict->pairs, dict->capacity *  
        sizeof(KeyValuePair));  
    }  
}
```

```

        strcpy(dict->pairs[dict->size].key, key);
        strcpy(dict->pairs[dict->size].value, value);
        dict->size++;
    }

    void removeKeyValuePair(Dictionary *dict, const char *key) {
        int found = 0;
        for (int i = 0; i < dict->size; i++) {
            if (strcmp(dict->pairs[i].key, key) == 0) {
                found = 1;
                for (int j = i; j < dict->size - 1; j++) {
                    dict->pairs[j] = dict->pairs[j + 1];
                }
                dict->size--;
                break;
            }
        }
    }
}

```

```

    int doesKeyExist(Dictionary *dict, const char *key) {
        for (int i = 0; i < dict->size; i++) {
            if (strcmp(dict->pairs[i].key, key) == 0) {
                return 1;
            }
        }
        return 0;
    }
}

```

```

    void printDictionary(Dictionary *dict) {
        for (int i = 0; i < dict->size; i++) {
            printf("Key: %s; Value: %s\n", dict->pairs[i].key, dict->pairs[i].value);
        }
    }
}

```
